ABSTRACTED-PUB-NO: EP 893775A

BASIC-ABSTRACT:

The method for managing power supply involves inputting the maximum generating capacities for each utility competing within the electricity supply market, and price functions at which a utility is willing to sell its power at a given time period. Also input are the weather forecast and transmission costs and transmission capacity in different power lines of the electrical system.

The method further involves forecasting the spot price of electrical power in the

deregulated market, and the amounts of power that may be traded. The forecasts are made at different delivery points, to provide probabilistic distributions for spot prices and trading.

USE - In electricity network for managing power supply by forecasting spot-market process of electrical power and trading transactions at different delivery points.

ADVANTAGE - Allows proper risk management of power supply within electricity network.
